VAS DEVELOPER API

VAS is proud to partner with leaders across the industry and harness the power of our API to support shared customers with a seamless and comprehensive herd management solution. Together, we can deliver complementary and mutually beneficial data sets and tools — all in the VAS PULSE Platform!

Harness the power of the VAS Developer API to:

- Share real-time data between our partners' systems and the PULSE Platform!

- Empower our customers to see available partner connections and initiate the exchange of data. Our complementary data sets drive our customers' insights and allow for more accurate, data-driven decisions.

- Offer significant speed and stability enhancements over flat-file data exchange. By moving to the cloud and away from any on-premise system restrictions, you can send and receive data anytime, anywhere!

- Follow ICAR standards and deliver common and reusable data outputs that support collaborative analytics and research efforts around the globe.

- Provide a wide array of available endpoints at the animal, pen, group, and herd levels, including access ranging from current animal status details to historical record consumption.

- Leverage POST endpoints for data entry at the individual animal level to deliver and maintain detailed animal event records. Use the larger data set to track and analyze changes over time.
